
Introduction to Computer Vision

Dr. Gerhard Roth

COMP 4102A

Winter 2014

Version 1

General Information

Instructor: Adjunct Prof.

Gerhard Roth gerhardroth@rogers.com – read hourly
gerhardroth@cmail.carleton.ca - read ever few hours

Office Hours: 2:30 to 4:00, Wed/Fri HP5331
(right before the lectures)

TA: Nathan Bell marks the assignments under my supervision, while I mark the two midterms.

Course website:

<http://people.scs.carleton.ca/~roth/comp4102a-14/>

Linked from <http://www.scs.carleton.ca/courses/>

Lectures in pdf have a version number, so you can check for updates – which are periodic

Course Organization

Textbook: Introductory Techniques for 3-D Computer Vision, by Trucco and Verri

No longer in print, CD has scanned chapters

Also contains SzeliskiBook_20100903_draft which will be used for some of the course (to be decided)

Two parts:

Part I (Before Feb. break) – Introduction, Review of linear algebra, Image formation, Image processing, Edge detection, Corner detection.

Part II (After Feb. break) – Camera calibration, Homography, Correspondence, Stereo, Epipolar geometry, Active sensors

Evaluation

Four or five assignments (40%)

- two before break and two after

- three or four of them will involve programming

- submit via CuLearn or put in the dropbox at
3115 HP (or e-mail me)

Two mid-terms (60% - 30% each)

- one just before reading week break, one at end
of term (just before the exam period)

- will cover material up to that point, so once
tested material in first part is not tested again

What is Computer Vision?

The goal of computer vision is to develop algorithms that allow computer to “see”.

Computer vision is sometimes called the inverse problem of computer graphics

Also called

- Image Understanding
- Image Analysis
- Machine Vision

General visual perception is hard

A brief history of computer vision

- 1960s - started as a student summer project at MIT.
- 1970s and 80s – part of AI – understanding human vision and emulating human perception.
- 1990s – depart from AI , geometric approach.
- Today – various mathematical methods (statistics, differential equations, optimization), applications (security, robotics, graphics).
- Many applications of computer vision are now in common usage

What is Computer Vision?

Trucco & Verri:

Computing properties of the 3-D world from one or more digital images.

Properties: mainly physical (geometric, dynamic, etc.)

One common definition:

Computer vision is inverse optics or inverse graphics.

Related fields

- Image Processing
 - Generates one image from another – i.e. sharpen
- Pattern Recognition
 - Learn patterns for classifying or analyzing data – i.e. character recognition
- Photogrammetry
 - Measures 3d quantities from multiple 2d images – i.e. model building
- Computer graphics
 - Take a virtual scene and render it – i.e. gaming
- Human/Computer Interfaces
 - Ways of interacting between a computer and a human – i.e. kinect for xbox

Our Time

It is a good time to do computer vision now, because:

- Powerful computers
- Inexpensive cameras
- Algorithm improvements
- Understanding of vision systems
- Modern computer networks
- Cameras everywhere
 - Including mobile devices
- However one problem!
 - Doing anything reliably is very difficult!

Human Computer Interfaces

- Microsoft Kinect camera
 - Uses infrared projected patterns
 - Single camera sees these and computes 3d data
 - Basically depth values on top of image pixel values
- 3d depth data is easier to use than 2d
 - At least for applications such as motion detection
 - Can detect motion of a person (including arms/legs)
- Use this motion information to control game
 - A more complex input device than the Wii
 - Wii also uses computer vision technology

Typical structure light system

Kinect system

Kinect system

3D Reconstruction

Augmented Reality

Fig. 2: A Virtual Object on a Card

Panoramic Mosaics

+

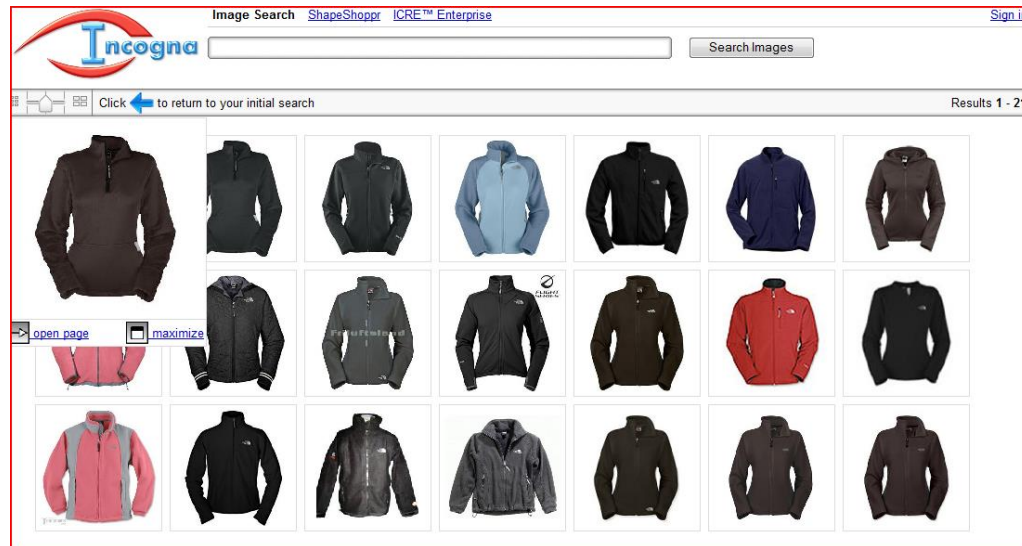

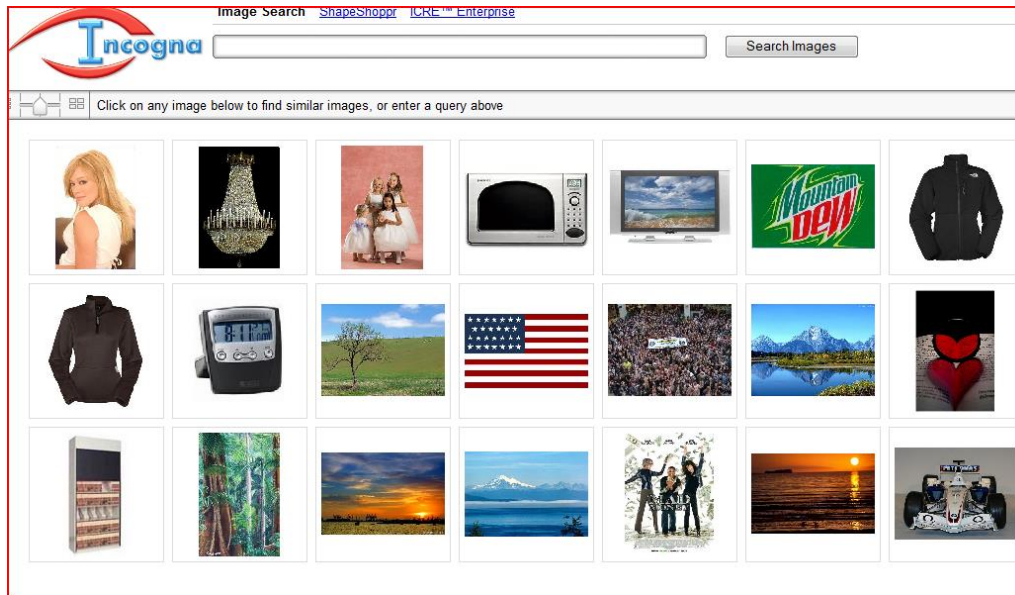

+ ... +

=

Image Search: www.incogna.com

Applications: Recognition

Applications: Special Effects

ESC Entertainment, XYZRGB, NRC

Applications: Special Effects

Andy Serkis, Gollum, Lord of the Rings

Motion capture systems

- Put retro-reflective balls everywhere
- Track these in real-time to get 3d positions

Applications: Medical Imaging

Autonomous Vehicle

Flakey, SRI

Applications: Robotics

Applications: Surveillance

Mathematical tools

- Linear algebra
- Vector calculus
- Euclidean geometry
- Projective geometry
- Differential geometry
- Differential equations
- Numerical analysis
- Probability and statistics

Programming tools

- OpenCV
 - A universal toolbox for research and development in the field of Computer Vision
 - Widely used OpenSource library written in C/C++
 - Capable of running in real-time applications
 - OS/hardware/window-manager independent
 - Simple Gui environment with sliders/mouse interaction
 - Routines for a large variety of computer vision algorithms
 - Works on Windows, Linux, Android, and IOS
 - In windows require Visual Studio environment (free for you!)
 - Easiest way to learn is to look at the sample code
 - [OpenCV Wiki](#) and the on-line documentation
 - There are a number of different versions – I have included latest version on your DVD along with instructions

OpenCV Functionality

Image data manipulation

- allocation, release, copying, setting, conversion

Image and video I/O

- file and camera based input, image/video file output

Matrix and vector manipulation, and linear algebra routines

- products, solvers, eigenvalues, SVD

Various dynamic data structures

- lists, queues, sets, trees, graphs

Basic image processing

- filtering, edge detection, corner detection, sampling and interpolation, color conversion, morphological operations, histograms, image pyramids

OpenCV Functionality (*cont.*)

Structural analysis

- connected components, contour processing, distance transform, various moments, template matching, Hough transform, polygonal approximation, line fitting, ellipse fitting, Delaunay triangulation

Camera calibration

- finding and tracking calibration patterns, calibration, fundamental matrix estimation, homography estimation, stereo correspondence

Motion analysis

- optical flow, motion segmentation, tracking

Object recognition

- eigen-methods, HMM

Basic GUI

- display image/video, keyboard and mouse handling, scroll-bars

Image labeling

- line, conic, polygon, text drawing

OpenCV Modules

OpenCV Functionality

- more than 350 algorithms

Cxcore

- Data structures and linear algebra support.

cv

- Main OpenCV functions.

Cvaux

- Auxiliary (experimental) OpenCV functions.

Highgui

- GUI functions.

Course DVD – OpenCV plus lectures

- Contains OpenCV and an example program along with a copy of the course web site
 - But you should look at course web site for current updates
- <http://opencv.willowgarage.com/wiki/> has detailed instructions on most recent version
 - But read my notes in the DVD to see easiest approach!
- Easiest approach is different
 - Install some version of Visual Studio (Version 10 is best)
 - Install OpenCV (OpenCV2.4.8)
 - In directory OpenCV example open the HarrisCorner project
 - Use X86 or w32 mode, depending on your machine
 - To try out different example programs replace HarrisCorner.cpp with the other .cpp and .c files
