Introduction

## Objectives

How to find efficiently

1. Similar documents among a collection of documents
2. Similar web-pages among web-pages
3. Similar fingerprints among a database of fingerprints
4. Similar sets among a collection of sets
5. Similar images from a database of images
6. Similar vectors in higher dimensions.

## Similarity of Documents

## Similarity of Documents

## Problem Definition <br> Input: A collection of web-pages. <br> Output: Report near duplicate web-pages.

## k-shingles

Any substring of $k$ words that appears in the document.

Text Document = "What is the likely date that the regular classes may resume in Ontario"
2 -shingles: What is, is the, the likely, ... , in Ontario
3 -shingles: What is the, is the likely, ..., resume in Ontario
In practice: 9-shingles for English Text and 5-shingles for e-mails

## Similarity between sets

## Text Document $D \rightarrow$ Set $S$

1. Form all the $k$-shingles of $D$
2. $S$ is the collection of all $k$-shingles of $D$

## Jaccard Similarity

For a pair of sets $S$ and $T$, the Jaccard Similarity is defined as $\operatorname{SIM}(S, T)=\frac{|S \cap T|}{|S \cup T|}$

Figure 1: $|S|=8,|T|=5,|S \cup T|=10,|S \cap T|=3, \operatorname{SIM}(S, T)=\frac{|S \cap T|}{|S \cup T|}=\frac{3}{10}$

## Problem: Find Similar Sets

## New Problem

Given a constant $0 \leq s \leq 1$ and a collection of sets $\mathcal{S}$, find the pairs of sets in $\mathcal{S}$ with Jaccard similarity $\geq s$
$U=\{$ Cruise, Ski, Resorts, Safari, Stay@Home $\}$

$$
\begin{array}{ll}
S_{1}=\{\text { Cruise, Safari }\} & S_{3}=\{\text { Ski, Safari, Stay@Home }\} \\
S_{2}=\{\text { Resorts }\} & S_{4}=\{\text { Cruise, Resorts, Safari }\}
\end{array}
$$

Problem: Given $\mathcal{S}=\left\{S_{1}, S_{2}, S_{3}, S_{4}\right\}$ and $s=\frac{1}{2}$, report all pairs that are $s$-similar.

$$
\begin{array}{ll}
\operatorname{SIM}\left(S_{1}, S_{2}\right)=\frac{0}{3}=0 & \operatorname{SIM}\left(S_{2}, S_{3}\right)=\frac{0}{4}=0 \\
\operatorname{SIM}\left(S_{1}, S_{3}\right)=\frac{1}{4} & \operatorname{SIM}\left(S_{2}, S_{4}\right)=\frac{1}{3} \\
\operatorname{SIM}\left(S_{1}, S_{4}\right)=\frac{2}{3} & \operatorname{SIM}\left(S_{3}, S_{4}\right)=\frac{1}{5}
\end{array}
$$

## Characteristic Matrix Representation of Sets

$U=\{$ Cruise, Ski, Resorts, Safari, Stay@Home $\}$
$\mathcal{S}=\left\{S_{1}, S_{2}, S_{3}, S_{4}\right\}$, where each $S_{i} \subseteq U$
e.g. $S_{1}=\{$ Cruise, Safari $\}$ and $S_{2}=\{$ Resorts $\}$

Characteristic matrix for $\mathcal{S}$ :

|  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- |
| Cruise | 1 | 0 | 0 | 1 |
| Ski | 0 | 0 | 1 | 0 |
| Resorts | 0 | 1 | 0 | 1 |
| Safari | 1 | 0 | 1 | 1 |
| Stay@Home | 0 | 0 | 1 | 0 |

## MinHash Signatures via Random Permutation

Permute Rows of characteristic matrix $-\pi: 01234 \rightarrow 40312$

|  |  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | Cruise | 1 | 0 | 0 | 1 |
| 1 | Ski | 0 | 0 | 1 | 0 |
| 2 | Resorts | 0 | 1 | 0 | 1 |
| 3 | Safari | 1 | 0 | 1 | 1 |
| 4 | Stay@Home | 0 | 0 | 1 | 0 |

| $\pi$ |  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :---: | :--- | :--- | :--- | :--- | :--- |
| $1 \rightarrow 0$ | Ski | 0 | 0 | 1 | 0 |
| $3 \rightarrow 1$ | Safari | 1 | 0 | 1 | 1 |
| $4 \rightarrow 2$ | Stay@Home | 0 | 0 | 1 | 0 |
| $2 \rightarrow 3$ | Resorts | 0 | 1 | 0 | 1 |
| $0 \rightarrow 4$ | Cruise | 1 | 0 | 0 | 1 |

Minhash Signatures for a set $S_{i}$ w.r.t. $\pi$ is the row-number of first non-zero element in the column corresponding to $S_{i}$
$h\left(S_{1}\right)=1$
$h\left(S_{2}\right)=3$
$h\left(S_{3}\right)=0$
$h\left(S_{4}\right)=1$

## Key Lemma

## Lemma

For any two sets $S_{i}$ and $S_{j}$ in a collection of sets $\mathcal{S}$ where the elements are drawn from the universe $U$, the probability that the minhash value $h\left(S_{i}\right)$ equals $h\left(S_{j}\right)$ is equal to the Jaccard similarity of $S_{i}$ and $S_{j}$, i.e.,

$$
\operatorname{Pr}\left[h\left(S_{i}\right)=h\left(S_{j}\right)\right]=\operatorname{SIM}\left(S_{i}, S_{j}\right)=\frac{\left|S_{i} \cap S_{j}\right|}{\left|S_{i} \cup S_{j}\right|} .
$$

|  |  | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | Ski | 0 | 0 | 1 | 0 |
| 1 | Safari | 1 | 0 | 1 | 1 |
| 2 | Stay@Home | 0 | 0 | 1 | 0 |
| 3 | Resorts | 0 | 1 | 0 | 1 |
| 4 | Cruise | 1 | 0 | 0 | 1 |

$\operatorname{Pr}\left[h\left(S_{1}\right)=h\left(S_{4}\right)\right]=\operatorname{SIM}\left(S_{1}, S_{4}\right)=\frac{\left|S_{1} \cap S_{4}\right|}{\left|S_{1} \cup S_{4}\right|}=\frac{2}{3}$

## Proof of Key Lemma

Consider the rows corresponding to the columns of $S_{i}$ and $S_{j}$.
Let $x=$ Number of rows where both the columns have a 1 .
Let $y=$ Number of rows where exactly one of the columns has a 1 .

| $S_{1}$ | $S_{4}$ |  |  |
| :--- | :--- | :--- | :--- |
| 0 | 0 |  |  |
| 1 | 1 | $\rightarrow$ | $x$ |
| 0 | 0 |  |  |
| 0 | 1 | $\rightarrow$ | $y$ |
| 1 | 1 | $\rightarrow$ | $x$ |

Observe that $\left|S_{i} \cap S_{j}\right|=x$ and $\left|S_{i} \cup S_{j}\right|=x+y$.
Note that the rows where both the columns have 0's can't be the minHash signature of $S_{i}$ or $S_{j}$.

Probability that $h\left(S_{i}\right)=h\left(S_{j}\right)$ is same as that the row corresponding to $x$ is the 'first one' as compared to the rows corresponding to $y$.
Thus, $\operatorname{Pr}\left[h\left(S_{i}\right)=h\left(S_{j}\right)\right]=\frac{x}{x+y}=\frac{\left|S_{i} \cap S_{j}\right|}{\left|S_{i} \cup S_{j}\right|}=\operatorname{SIM}\left(S_{i}, S_{j}\right)$

## MinHashSignature Matrix

MinHash Signature matrix for $|\mathcal{S}|=11$ sets with 12 hash functions

| $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ | $S_{5}$ | $S_{6}$ | $S_{7}$ | $S_{8}$ | $S_{9}$ | $S_{10}$ | $S_{11}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 2 | 1 | 0 | 0 | 1 | 3 | 2 | 5 | 0 | 3 |
| 1 | 3 | 2 | 0 | 2 | 2 | 1 | 4 | 2 | 1 | 2 |
| 3 | 0 | 3 | 0 | 4 | 3 | 2 | 0 | 0 | 4 | 2 |
| 0 | 4 | 3 | 1 | 5 | 3 | 3 | 2 | 3 | 5 | 4 |
| 2 | 1 | 1 | 0 | 4 | 1 | 2 | 1 | 4 | 2 | 5 |
| 4 | 2 | 1 | 0 | 5 | 2 | 3 | 2 | 3 | 5 | 4 |
| 2 | 4 | 3 | 0 | 5 | 3 | 3 | 4 | 4 | 5 | 3 |
| 0 | 2 | 4 | 1 | 3 | 4 | 3 | 2 | 2 | 2 | 4 |
| 0 | 2 | 1 | 0 | 5 | 1 | 1 | 1 | 1 | 5 | 1 |
| 0 | 5 | 1 | 0 | 2 | 1 | 3 | 2 | 1 | 5 | 4 |
| 1 | 3 | 1 | 0 | 5 | 2 | 3 | 3 | 6 | 3 | 2 |
| 0 | 5 | 2 | 1 | 5 | 1 | 2 | 2 | 6 | 5 | 4 |

LSH

## LSH for MinHash

Partitioning of a signature matrix into $b=4$ bands of $r=3$ rows each.

| Band | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ | $S_{5}$ | $S_{6}$ | $S_{7}$ | $S_{8}$ | $S_{9}$ | $S_{10}$ | $S_{11}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I | 2 | 2 | 1 | 0 | 0 | 1 | 3 | 2 | 5 | 0 | 3 |
|  | 1 | 3 | 2 | 0 | 2 | 2 | 1 | 4 | 2 | 1 | 2 |
|  | 3 | 0 | 3 | 0 | 4 | 3 | 2 | 0 | 0 | 4 | 2 |
| II | 0 | 4 | 3 | 1 | 5 | 3 | 3 | 2 | 3 | 5 | 4 |
|  | 2 | 1 | 1 | 0 | 4 | 1 | 2 | 1 | 4 | 2 | 5 |
|  | 4 | 2 | 1 | 0 | 5 | 2 | 3 | 2 | 3 | 5 | 4 |
| III | 2 | 4 | 3 | 0 | 5 | 3 | 3 | 4 | 4 | 5 | 3 |
|  | 0 | 2 | 4 | 1 | 3 | 4 | 3 | 2 | 2 | 2 | 4 |
|  | 0 | 2 | 1 | 0 | 5 | 1 | 1 | 1 | 1 | 5 | 1 |
| IV | 0 | 5 | 1 | 0 | 2 | 1 | 3 | 2 | 1 | 5 | 4 |
|  | 1 | 3 | 1 | 0 | 5 | 2 | 3 | 3 | 6 | 3 | 2 |
|  | 0 | 5 | 2 | 1 | 5 | 1 | 2 | 2 | 6 | 5 | 4 |

Band 3: $\left\{S_{3}, S_{6}, S_{11}\right\}$ are hashed into the same bucket, and so are $\left\{S_{8}, S_{9}\right\}$

## Probability of finding similar sets

## Lemma

Let $s>0$ be the Jaccard similarity of two sets. The probability that the minHash signature matrix agrees in all the rows of at least one of the bands for these two sets is $f(s)=1-\left(1-s^{r}\right)^{b}$.

| Band | $S_{1}$ | $S_{2}$ | $S_{3}$ | $S_{4}$ | $S_{5}$ | $S_{6}$ | $S_{7}$ | $S_{8}$ | $S_{9}$ | $S_{10}$ | $S_{11}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I | 2 | 2 | 1 | 0 | 0 | 1 | 3 | 2 | 5 | 0 | 3 |
|  | 1 | 3 | 2 | 0 | 2 | 2 | 1 | 4 | 2 | 1 | 2 |
|  | 3 | 0 | 3 | 0 | 4 | 3 | 2 | 0 | 0 | 4 | 2 |
| II | 0 | 4 | 3 | 1 | 5 | 3 | 3 | 2 | 3 | 5 | 4 |
|  | 2 | 1 | 1 | 0 | 4 | 1 | 2 | 1 | 4 | 2 | 5 |
|  | 4 | 2 | 1 | 0 | 5 | 2 | 3 | 2 | 3 | 5 | 4 |
| III | 2 | 4 | 3 | 0 | 5 | 3 | 3 | 4 | 4 | 5 | 3 |
|  | 0 | 2 | 4 | 1 | 3 | 4 | 3 | 2 | 2 | 2 | 4 |
|  | 0 | 2 | 1 | 0 | 5 | 1 | 1 | 1 | 1 | 5 | 1 |
| IV | 0 | 5 | 1 | 0 | 2 | 1 | 3 | 2 | 1 | 5 | 4 |
|  | 1 | 3 | 1 | 0 | 5 | 2 | 3 | 3 | 6 | 3 | 2 |
|  | 0 | 5 | 2 | 1 | 5 | 1 | 2 | 2 | 6 | 5 | 4 |

## Proof

Claim: $\operatorname{Pr}\left(\right.$ signatures agree in all rows of $\geq 1$ bands for $S_{i}$ and $S_{j}$ with Jaccard Similarity $s)=f(s)=1-\left(1-s^{r}\right)^{b}$. Answer the following:

1. Probability that the signature agrees in a row
2. Probability that the signature agrees in all rows of a band
3. Probability that the signature doesn't agree in at least one of the rows of a band
4. Probability that the signature doesn't agree in any of the bands
5. Probability that the signature agrees in at least one of the bands

## Understanding $f(s)$

$$
f(s)=1-\left(1-s^{r}\right)^{b} \text { for different values of } s, b, \text { and } r \text { : }
$$

| $(b, r)$ <br> $f(s)=1-\left(1-s^{r}\right)^{b} \searrow$ | $(4,3)$ | $(16,4)$ | $(20,5)$ | $(25,5)$ | $(100,10)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $s=0.2$ | 0.0316 | 0.0252 | 0.0063 | 0.0079 | 0.0000 |
| $s=0.4$ | 0.2324 | 0.3396 | 0.1860 | 0.2268 | 0.0104 |
| $s=0.5$ | 0.4138 | 0.6439 | 0.4700 | 0.5478 | 0.0930 |
| $s=0.6$ | 0.6221 | 0.8914 | 0.8019 | 0.8678 | 0.4547 |
| $s=0.8$ | 0.9432 | 0.9997 | 0.9996 | 0.9999 | 0.9999 |
| $s=1.0$ | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 |
| Threshold $t=\left(\frac{1}{b}\right)^{\left(\frac{1}{r}\right)}$ | 0.6299 | 0.5 | 0.5492 | 0.5253 | 0.6309 |

## Comments on $S$-Curve

1. For what values of $s, f^{\prime \prime}(s)=0$ ?
$s=\left(\frac{r-1}{b r-1}\right)^{\frac{1}{r}}$
2. For values of $b r \gg 1, s \approx\left(\frac{1}{b}\right)^{\frac{1}{r}}$
3. Steepest slope occurs at $s \approx(1 / b)^{(1 / r)}$
4. If the Jaccard similarity $s$ of the two sets is above the threshold $t=\left(\frac{1}{b}\right)^{\frac{1}{r}}$, the probability that they will be found potentially similar is very high.
5. Consider the entries in the row corresponding to $s=0.8$ in the table and observe that most of the values for $f(s=0.8) \rightarrow 1$ as $s>t$.

## Computational Summary

- Input: Collection of $m$ text documents of size $\mathcal{D}$
- $k$-shingles: $\mathrm{Size}=k \mathcal{D}$
- Characteristic matrix of size $|U| \times m$, where $U$ is the universe of all possible $k$-shingles
- Signature matrix of size $n \times m$ using $n$-permutations
- $\left\lceil\frac{n}{r}\right\rceil$ bands each consisting of $r$ rows
- Hash maps from bands to buckets
- Output: All pairs of documents that are in the same bucket corresponding to a band
- Check whether the pairs correspond to similar documents!
- With the right choice of threshold $\operatorname{Pr}($ the pair is similar) $\rightarrow 1$

## What makes LSH works?

How can we apply for other 'similarity' problems?
How can we apply for 'nearest neighbor' problems?

## Metric Spaces

## Metric Spaces

Consider a finite set $X$. A metric or distance measure $d$ on $X$ is a function $d: X \times X \rightarrow[0, \infty)$ satisfying the following properties. For all elements $u, v, w \in X$ :

1. Non-negativity: $d(u, v) \geq 0$.
2. Symmetric: $d(u, v)=d(v, u)$.
3. Identity: $d(u, v)=0$ if and only if $u=v$.
4. Triangle Inequality: $d(u, v)+d(v, w) \geq d(u, w)$.

Examples: Euclidean distance among set of $n$-points in plane.

## Euclidean Distance

Let $X=$ Set of $n$-points in plane.
Euclidean distance between any two points $p_{i}=\left(x_{i}, y_{i}\right)$ and $p_{j}=\left(x_{j}, y_{j}\right)$ is $d\left(p_{i}, p_{j}\right)=\sqrt{\left(x_{i}-x_{j}\right)^{2}+\left(y_{i}-y_{j}\right)^{2}}$.

## Euclidean Distance Metric

$X$ with the Euclidean distance measure satisfies the metric properties.

1. Non-negativity: $d(u, v) \geq 0$.
2. Symmetric: $d(u, v)=d(v, u)$.
3. Identity: $d(u, v)=0$ if and only if $u=v$.
4. Triangle Inequality: $d(u, v)+d(v, w) \geq d(u, w)$.

## Hamming Distance Metric

$X=$ Set of $d$-dimensional Boolean vectors.
Hamming distance HAM $(u, v)=$ Number of coordinates in which two vectors $u, v \in X$ differ.

An Example: $\begin{array}{|lllllllll|}u= & 1 & 0 & 0 & 1 & 1 & 0 & 1 & 1 \\ v= & 1 & 1 & 0 & 0 & 1 & 1 & 1 & 1 \\ & H A M\end{array}(u, v)=3$

## Hamming Distance Metric

Hamming distance is a metric over the $d$-dimensional vectors.

1. Non-negativity: $\operatorname{HAM}(u, v) \geq 0$.
2. Symmetric: $\operatorname{HAM}(u, v)=\operatorname{HAM}(v, u)$.
3. Identity: $\operatorname{HAM}(u, v)=0$ if and only if $u=v$.
4. Triangle Inequality: $\operatorname{HAM}(u, v)+\operatorname{HAM}(v, w) \geq \operatorname{HAM}(u, w)$.

## Jaccard Distance Metric

$\mathcal{S}=$ A collection of sets.
Jaccard Similarity doesn't satisfy metric properties, e.g. $\operatorname{SIM}(S, S)=1$.
Define Jaccard Distance between two sets $S_{i}, S_{j} \in \mathcal{S}$ as
$\mathrm{JD}\left(S_{i}, S_{j}\right)=1-\operatorname{SIM}\left(S_{i}, S_{j}\right)$.

## Jaccard Distance Metric

Set $\mathcal{S}$ with the Jaccard distance measure satisfies the metric properties.

1. Non-negativity: $\mathrm{JD}\left(S_{i}, S_{j}\right) \geq 0$.
2. Symmetric: $\mathrm{JD}\left(S_{i}, S_{j}\right)=\mathrm{JD}\left(S_{j}, S_{i}\right)$.
3. Identity: JD $\left(S_{i}, S_{j}\right)=0$ if and only if $S_{i}=S_{j}$.
4. Triangle Inequality: $\mathrm{JD}\left(S_{i}, S_{j}\right)+\mathrm{JD}\left(S_{j}, S_{k}\right) \geq \mathrm{JD}\left(S_{i}, S_{k}\right)$.

## Sensitive Function Family

## Sensitive Family of Functions

Let $d$ be a distance measure and let $d_{1}<d_{2}$ be two distances. Let
$0 \leq p_{2}<p_{1} \leq 1$. A family of functions $\mathcal{F}$ is said to be ( $d_{1}, d_{2}, p_{1}, p_{2}$ )-sensitive if for every $f \in \mathcal{F}$ the following two conditions hold;

1. If $d(x, y) \leq d_{1}$ then $\operatorname{Pr}[f(x)=f(y)] \geq p_{1}$.
2. If $d(x, y) \geq d_{2}$ then $\operatorname{Pr}[f(x)=f(y)] \leq p_{2}$.

## Family of MinHash Signatures

Consider the Jaccard distance measure for finding similar sets in a collection of sets $\mathcal{S}$.

```
Min-Hash Signature Family
Let 0\leqd}<<\mp@subsup{d}{2}{}\leq1. The family of minhash-signatures is
( }\mp@subsup{d}{1}{},\mp@subsup{d}{2}{},\mp@subsup{p}{1}{}=1-\mp@subsup{d}{1}{},\mp@subsup{p}{2}{}=1-\mp@subsup{d}{2}{})\mathrm{ -sensitive.
```

Proof: Suppose that the Jaccard similarity between two sets is at least $s$. Then their Jaccard distance is at most $d_{1}=1-s$. The probability that they will be hashed to the same bucket by minhash signatures is
$\geq p_{1}=s=1-d_{1}$.
Now suppose that the Jaccard similarity is at most $s^{\prime}$. Then their Jaccard distance is at least $d_{2}=1-s^{\prime}$. The probability that the minhash signatures map them to the same bucket is at most $p_{2}=s^{\prime}=1-d_{2}$.

## LSH Family for Hamming Distance

Consider two $d$-dimensional Boolean vectors $u$ and $v$.
$\operatorname{HAM}(u, v)=$ Number of coordinates in which $u$ and $v$ differ
Let $f_{i}(x)=i$-th coordinate of $u$.
For a randomly chosen index $i, \operatorname{Pr}\left[f_{i}(u)=f_{i}(v)\right]=1-\frac{\operatorname{HAM}(u, v)}{d}$

Example: | $u=$ | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $v=$ | 1 | 1 | 0 | 0 | 1 | 1 | 1 | 1 |

$\operatorname{Pr}\left[f_{i}(u)=f_{i}(v)\right]=1-\frac{\operatorname{HAM}(u, v)}{d}=1-\frac{3}{8}=\frac{5}{8}$

## Sensitive-family for Hamming distance

For any $d_{1}<d_{2}, \mathcal{F}=\left\{f_{1}, f_{2}, \ldots, f_{d}\right\}$ is a $\left(d_{1}, d_{2}, 1-d_{1} / d, 1-d_{2} / d\right)$-sensitive family of functions.

Proof: Let $p_{1}=1-d_{1} / d$ and $p_{2}=1-d_{2} / d$.
A family of functions $\mathcal{F}$ is said to be $\left(d_{1}, d_{2}, p_{1}, p_{2}\right)$-sensitive if for every $f_{i} \in \mathcal{F}$ the following two conditions hold:

1. If $\operatorname{HAM}(u, v) \leq d_{1}$ then $\operatorname{Pr}\left[f_{i}(u)=f_{i}(v)\right] \geq p_{1}$
2. If $\operatorname{HAM}(u, v) \geq d_{2}$ then $\operatorname{Pr}\left[f_{i}(u)=f_{i}(v)\right] \leq p_{2}$

## LSH Family for Near Neighbors in 2D

$P=$ Set of points in 2D and $\Delta>0$ a parameter.
Define hash function $f_{l}$ by a line $l$ with random orientation as follows:
Partition $l$ into intervals of equal size $2 \Delta$.
Orthogonally project all points of $P$ on $l$.
Let $f_{l}(x)$ be the interval in which $x \in P$ projects to.

## LSH Family for Near Neighbors

## Sensitive Family via Projection on a Random Line

The family of hash functions with respect to the projection on a random line with intervals of size $2 \Delta$ is a $(\Delta, 4 \Delta, 1 / 2,1 / 3)$-sensitive family.

Proof: Assume $l$ is horizontal.
We first show that if $d(x, y) \leq \Delta$, then $\operatorname{Pr}\left[f_{l}(x)=f_{l}(y)\right] \geq 1 / 2$.
Let $m$ be the mid-point of the interval $f_{l}(x)$.
In $f_{l}(x)$, with probability $1 / 2$ the projection of $x$ lies to the left of $m$ and with probability $1 / 2$, the projection of $y$ lies to the right of projection of $x$.
$\Longrightarrow$ projection of $y$ lies in $f_{l}(x)$ (i.e., $\left.f_{l}(x)=f_{l}(y)\right)$ as $d(x, y) \leq \Delta$.
Thus with probability $1 / 4$, projections of $x$ and $y$ lie in $f_{l}(x)$ where the projection of $x$ is to the left of $m$ and the projection of $y$ is to the right of the projection of $x$.

Same reasoning holds when $f_{l}(x)$ is to the right of $m$ and the projection of $y$ is to the left of the projection of $x$.

Since the above two cases are mutually exclusive, $\operatorname{Pr}\left[f_{l}(x)=f_{l}(y)\right] \geq 1 / 2$.

## Proof (contd.)

Now consider the case when $d(x, y)>4 \Delta$.

We want to show that $\operatorname{Pr}\left[f_{l}(x)=f_{l}(y)\right] \leq 1 / 3$.
Let $\theta$ be the angle of the line passing through $x$ and $y$ with respect to $l$.
For the projections of $x$ and $y$ to fall in the same interval, we will need that $d(x, y) \cos \theta \leq 2 \Delta$.

For this to happen $\cos \theta \leq 1 / 2$, or the angle the line $x y$ forms with the horizontal needs to be between $60^{\circ}$ and $90^{\circ}$.

This has at most $1 / 3$-rd chance.

## AND-OR Family

## AND-Family

Let $\mathcal{F}$ be $\left(d_{1}, d_{2}, p_{1}, p_{2}\right)$-sensitive family.
Construct a new family $\mathcal{G}$ by an AND-construction as follows:
AND-Family: Each function $g \in \mathcal{G}$ is formed from a set of $r$ independently chosen functions of $\mathcal{F}$, say $f_{1}, f_{2}, \ldots, f_{r}$ for some fixed value of $r$.
Now, $g(x)=g(y)$ if and only if for all $i=1, \ldots, r, f_{i}(x)=f_{i}(y)$.

## AND-Family

$\mathcal{G}$ is an $\left(d_{1}, d_{2}, p_{1}^{r}, p_{2}^{r}\right)$-sensitive AND family.
Proof: This is the probability of all the $r$ independent events to occur simultaneously.

## OR-Family

OR-Family: Each member $g$ in $\mathcal{G}$ is constructed by taking $b$ independently chosen members $f_{1}, f_{2}, \ldots, f_{b}$ from $\mathcal{F}$.
Now $g(x)=g(y)$ if and only if $f_{i}(x)=f_{i}(y)$ for at least one of the members in $\left\{f_{1}, f_{2}, \ldots, f_{b}\right\}$.

## OR-Family

$\mathcal{G}$ is an $\left(d_{1}, d_{2}, 1-\left(1-p_{1}\right)^{b}, 1-\left(1-p_{2}\right)^{b}\right)$-sensitive OR family.
Proof: Estimate the probability that none of the $b$-events occur and then look at the complementary event.

## Probabilistic Amplification

|  | $\mathcal{F}_{1}$ (AND) | $\mathcal{F}_{2}(\mathrm{OR})$ | $\mathcal{F}_{3}$ (AND-OR) | $\mathcal{F}_{4}$ (OR-AND) |
| :---: | :---: | :---: | :---: | :---: |
| $p$ | $p^{r}$ | $1-(1-p)^{b}$ | $1-\left(1-p^{r}\right)^{b}$ | $\left(1-(1-p)^{r}\right)^{b}$ |
| 0.2 | 0.0001 | 0.6723 | 0.0079 | 0.0717 |
| 0.4 | 0.0256 | 0.9222 | 0.1216 | 0.4995 |
| 0.6 | 0.1296 | 0.9897 | 0.5004 | 0.8783 |
| 0.7 | 0.2401 | 0.9975 | 0.7446 | 0.9601 |
| 0.8 | 0.4096 | 0.9996 | 0.9282 | 0.9920 |
| 0.9 | 0.6561 | 0.9999 | 0.9951 | 0.9995 |

Table 1: Illustration of four families obtained for different values of $p . \mathcal{F}_{1}$ is the AND family for $r=4 . \mathcal{F}_{2}$ is OR family for $b=5 . \mathcal{F}_{3}$ is the AND-OR family for $r=4$ and $b=5 . \mathcal{F}_{4}$ is the OR-AND family for $r=4$ and $b=5$.

## Probabilistic Amplification Examples

We can apply the AND-OR amplification technique for any sensitive family. For example,

1. $\mathcal{F}$ be a $\left(d_{1}, d_{2}, p_{1}=1-d_{1}, p_{2}=1-d_{2}\right)$-sensitive minhash function family for similarity of sets.
2. Hamming distance $\left(d_{1}, d_{2}, 1-d_{1} / d, 1-d_{2} / d\right)$-sensitive family for finding similar Boolean strings.
3. Projection on a random line $(\Delta, 4 \Delta, 1 / 2,1 / 3)$-sensitive family for finding near points.
4. Metric Property $\rightarrow$ Sensitive Family $\rightarrow$ Probabilistic Amplification

Fingerprints

## Matching Fingerprints

Fingerprints consists of minutia points and patterns that form ridges and bifurcations

## Fingerprint with an overlay grid

Fingerprint mapped to a normalized grid cell

## Minutia of two fingerprints

Statistical Analysis from fingerprint analyst:

1. $\operatorname{Pr}($ minutia in a random grid cell of a fingerprint $)=0.2$
2. $\operatorname{Pr}$ (given two fingerprints of the same finger and that one fingerprint has a minutia in a grid cell, other fingerprint has the minutia in that cell) $=0.85$
3. Pick 3 random grid cells and define a (hash) function $f$ that sends two fingerprints to the same bucket if they have minutia in each of those three cells
4. $\operatorname{Pr}($ two arbitrary fingerprints will map to the same bucket by $f$ )
$=0.2^{6}=0.000064$
5. $\operatorname{Pr}(f$ maps the fingerprints of the same finger to the same bucket $)$ $=0.2^{3} \times 0.85^{3}=0.0049$

## Probabilistic Amplification

Suppose we have 1000 such functions and we take 'OR' of these functions

1. $\operatorname{Pr}$ (two fingerprints from different fingers map to the same bucket)

$$
=1-(1-0.000064)^{1000} \approx 0.061
$$

2. $\operatorname{Pr}($ two fingerprints of the same finger map to the same bucket)

$$
=1-(1-0.0049)^{1000} \approx 0.992
$$

Take two groups of 1000 functions each and report a match if it's a match in both the groups.

1. $\operatorname{Pr}$ (two fingerprints from different fingers map to the same bucket) $\approx 0.061^{2}=0.0037$
2. $\operatorname{Pr}($ two fingerprints of the same finger map to the same bucket) $\approx 0.992^{2}=0.984$
